FOG PROJECT ABOUT US DONATE **DOWNLOAD** GET SUPPORT SPONSORS

The latest release of FOG Project is **v1.5.0**, released February 26th 2018.

At this time, FOG Project can only be installed on a computer running Linux. We recommend using a Long Term Support distribution meant for servers, such as [CentOS](#) or [Debian](#), though you can use a variety of other distributions. We also recommend installing FOG Project inside a virtual machine, to aide in easy backups and upgrades.

Downloading

You can download a pre-packaged tarball of the latest release of FOG Project, v1.5.0, from [here](#). Please verify that your download matches one of the following checksums:

```
md5: 92d5a69b44e0e5cda33c4d5db73596d2 fog_1.5.0.tar.gz
sha1: 8e00ecada1f54dc69ae76f9f3e7329aecb151f3a fog_1.5.0.tar.gz
```

Installing

To install FOG Project, an internet connection is **required**. During installation, it will download other binaries and install any needed dependencies. More detailed guides can be found in the [wiki](#), however, installation is as simple as extracting the tarball and running the install script:

```
tar -xzvf fog_x.x.x.tar.gz
cd fog_x.x.x/bin
sudo ./install.sh
```

Next Steps

Once installed, check out the [wiki](#) for more information and guides. If you need help, head over to the [forums](#).

The image shows a terminal window with a title bar that reads "joe — joe@fog: ~ — ssh • ssh yavin — 80x22". Below the title bar, there are four tabs: the first is "ssh • ssh yavin", the second is "joe@fog: ~ — ssh • ssh yavin", the third is "...nloads/salt-vagrant-demo-master — -bash", and the fourth is "...m@ssh.cs.dixie.edu -L 7797:cordelia:7797". The main content of the terminal is a single line of text: "joe@fog:~\$ wget https://github.com/FOGProject/fogproject/releases/download/1.5.0/fog_1.5.0.tar.gz". The text is in a monospaced font, with "joe@fog" in green and the rest in black. A cursor is visible at the end of the command.

```
joe@fog:~$ wget https://github.com/FOGProject/fogproject/releases/download/1.5.0/fog_1.5.0.tar.gz
```

- * Here are the settings FOG will use:
- * Base Linux: Debian
- * Detected Linux Distribution: Ubuntu
- * Server IP Address: 144.38.201.40
- * Server Subnet Mask: 255.255.255.224
- * Interface: ens3
- * Installation Type: Normal Server
- * Internationalization: 0
- * Image Storage Location: /images
- * Using FOG DHCP: No
- * DHCP will NOT be setup but you must setup your
| current DHCP server to use FOG for PXE services.
- * On a Linux DHCP server you must set: next-server and filename
- * On a Windows DHCP server you must set options 066 and 067
- * Option 066/next-server is the IP of the FOG Server: (e.g. 144.38.201.40)
- * Option 067/filename is the bootfile: (e.g. undionly.kpxe)
- * Are you sure you wish to continue (Y/N) █

```
http://144.38.201.40/fog/management
```

```
* Press [Enter] key when database is updated/installed.█
```

FOG Project

Install/Update

If you would like to backup your FOG database you can do so using MySQL Administrator or by running the following command in a terminal window (Applications->System Tools->Terminal), this will save the backup in your home directory.

```
mysqldump --allow-keywords -x -v fog > fogbackup.sql
```

Your FOG database schema is not up to date, either because you have updated or this is a new FOG installation. If this is an upgrade, there will be a database backup stored on your FOG server defaulting under the folder /home/fogDBbackups. Should anything go wrong, this backup will enable you to return to the previous install if needed.

Are you sure you wish to install or update the FOG database?

 Deploy	Deploy action will send an image saved on the FOG server to the client computer with all included snapins.
 Capture	Capture will pull an image from a client computer that will be saved on the server.
 Advanced	View advanced tasks for this host.

The image shows a terminal window with a title bar that reads "joe — joe@fog: ~ — ssh · ssh yavin — 87x20". The window contains several tabs, with the active one being "joe@fog: ~ — ssh · ssh yavin". The terminal content is as follows:

```
joe@fog:~$ echo "we have to create an image first, before we can capture one"
we have to create an image first, before we can capture one
joe@fog:~$ █
```

Create Capture Tasking Task

The image shows a terminal window with a title bar that reads "joe — joe@fog: ~ — ssh · ssh yavin — 87x20". Below the title bar, there are several tabs representing different terminal sessions: "~ — joe@dhcp: ~ — ssh · ssh yavin", "~ — joe@fog: ~ — ssh · ssh yavin", "...k/salt — joe@db: ~ — ssh · ssh yavin", "...h.cs.dixie.edu -L 7797:cordelia:7797", and "...h.cs.dixie.edu -L 5971:cordelia:5971 ...". The main content of the terminal shows a command being executed: "joe@fog:~\$ echo "reboot that image"". The output of the command is "reboot that image". The prompt "joe@fog:~\$" is shown again on the next line, followed by a cursor.

```
joe@fog:~$ echo "reboot that image"
reboot that image
joe@fog:~$ █
```
